

How it was made

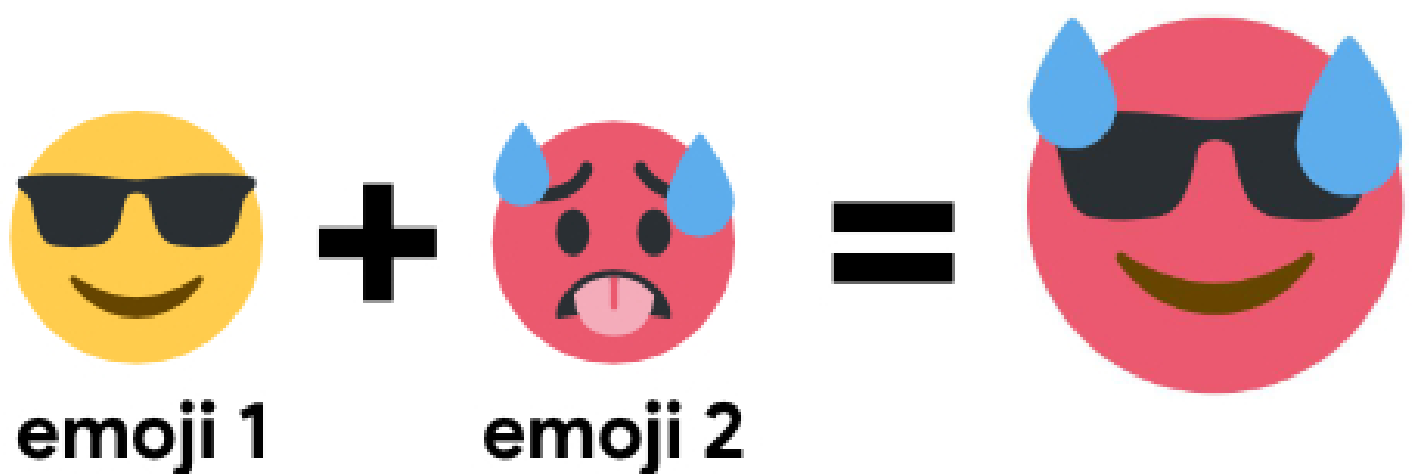

First of all, the bot selects two different emojis from a list

Every single emojis of that list have been cut into four pieces :

If the emojis have different bases

It takes the **eyes** and the **mouth** from the first emoji, and the **base** from the second emoji.

If the emojis have the same bases

It takes the **eyes** from the first emoji, and the **mouth** from the second emoji.

For the last piece it will always take the **detail** from the second emoji if it has one. If not, the **detail** will be taken from the first emoji.

If neither emojis have a **detail**, the new emoji won't have one either.

When all the pieces are selected they all merge using Processing wich will generate an image with the brand new emoji !
